

Revision 0.b Release Date July 14 2007

Revision Notes Initial Release

Technical Specifications Summary

Frequency Range:	170 - 230 MHz	Gain:	16 dB
P1dB:	200 Watts CW	Efficiency:	45%
Class:	AB	Temperature Range:	0 to +70°C
Supply Voltage:	32.0V	Max VSWR:	10:1

Amplifier General Description

The **P200-VHF-H-16-A0** is an integrated TV linear amplifier designed for the television integrator. Providing a minimum of 175W Pk sync linear power, the P200-VHF-H-16 is the perfect amplifier for any low band VHF transmitter. This cost effective building block makes a great IPA or can be combined in multiple arrays for high power PAs. This amplifier is built using third generation gold metallized LDMOS transistors.

- No RF assembly or circuit tuning!
- 200 Watts of Output Power!
- 16dB typical gain at Channel 13!
- Combined **Video and Aural** at full rated power!
- Modular Construction for ease of Integration!

Parameter	Min	Typ	Max	Units	Notes
Frequency	170		230	MHz	
P1dB		200		W, CW	
Linear Power Out	175	200		W, Pk Sync	
IMD3	-40			dBc	For 2 tones, 1 MHz spacing, 175 W PEP
Power Input		5	8	W, CW	
Gain	15	16		dB	
Vsupply	28	32	34	V, DC	
Drain Current		10	11	A, DC	
Input VSWR		1.2:1	1.5:1		
Insertion Phase Variation		±5		°	Unit to unit
Gain Variation		±1		dB	Unit to unit
F2 Second Harmonic		-35		dBc	
F3 Third Harmonic		-15		dBc	
Baseplate Operating Temperature	0		+70	°C	

Physical Dimensions 2.0" x 4.0" x 1.5" / 5cm x 10cm x 4cm

All specifications valid for 50 Ω output load, $V_{sup} = +28VDC$, $I_{dq} = 0.8A$

Absolute Maximum Ratings

Parameter	Value	Units	Notes
Maximum Operating Voltage	+34.0	VDC	
Stable Operating Voltage	+26.0 to +32.0	VDC	
Maximum Bias Current, Q100	3.0	A, DC	Factory set to .8A
Maximum Drain Current	14	A, DC	
Load Mismatch Survival	5:1		
Storage Temperature	-40 to +105	°C	
Maximum Operating Baseplate Temp	+70	°C	

Features, Auxillary Functions

Features Include:

- Temperature Compensated Bias
- Amplifier Disable
- Current Sense
- Connectorized Power and I/O

Tips for Mechanical Mounting:

- 1 All holes are clear for #6 Screw. Stainless Steel mounting hardware is recommended, grade 18-8 or better. A lock washer of same material should also be used.
- 2 Ensure mounting surface is flat to better than 0.003" / "
- 3 Use a thin layer of thermal compound on the backside of the PA - no more than 0.001" - 0.002" thickness!
- 4 Torque all screws to 10-12 in-lbs

Considerations for Mechanical Mounting:

- Considerations for proper thermal design include
- Total power dissipated = Total DC Power Consumed x (1-Efficiency)
- Ambient Airflow
- Thermal Resistance of Heat Sink

Electrical Connections:

Power 3.0mm Micro Connector: MOLEX 43025-1000 MOLEX Pin 43030-0001, 43030-0007 AMP 1-794617-0 AMP Pin 794610, 794606 or Solder directly to pad adjacent to connector	J101-1	CURRENT	Current Sense
	J101-2,3,8,9	GROUND	System Ground
	J101-4,5	Vsup	+28 to +32 VDC
	J101-6,7,10	N/C	No Connection

Connections:

Connect amplifier to +Vsup and Ground using either 3.0mm modular 10-position plug (J101) or soldering directly to pad adjacent to connector. If using Single connection, 14 gauge wire is recommended, 14 gauge ground wire. 20 gauge wire is recommended for use in modular connector, and all power connections must be used! In all cases, use of teflon insulated wire is highly recommended.

Amplifier Startup

+Vsup should be applied to amplifier with no drive applied. The system must allow drain voltage to reach +26V minimum before applying drive or damage can result to the amplifier and void warranty. This typically takes between 2 - 10 seconds and should be verified by the system integrator. The amplifier may be disabled by applying ground to TP1, which is the solder pad to the left of bias pot. This point must be allowed to float for proper operation.

Bias Current:

Bias current is controlled via temperature compensated bias system that uses a hermetically sealed glass thermistor as reference. If excessive air is directed above the amplifier such that the thermistor is cooled below the temperature of the baseplate, this circuitry may not perform properly. Bias has been pre-set at the factory to 0.5A at +32.0V DC. This bias point has been selected to offer the optimum balance between IMD performance, efficiency, and gain. If the bias point is changed, take great care to set the same bias point on each transistor in your system, and not to exceed the bias maximum listed on page 1.

Fault Condition - Bad VSWR

Current sense J101-1 should be monitored for excessive current. The voltage difference between J100-1 to J100-4,5 is scaled 1A per 0.010 V. If the transistor experiences currents in excess of normal operation, a fault condition exists, and the amplifier should be disabled through TP1 or removing drain voltage. If current on the transistor drops to below 0.5A indicated, a fault condition exists, and the amplifier should be disabled through TP1 or by removing drain voltage.

Amplifier Shutdown

To prevent damage to amplifier and surrounding systems, bias and drive should be removed prior to powering down PA. This can be accomplished by grounding TP1 and removing drive then powering down PA, or simply removing drive and powering down PA.

Miscellaneous:

It is normal for the output transformers (flexible coax on the output of transistor) to get warm during operation. These components are rated for continuous operation in excess of 150°C. Placing noisy analog or digital systems, such as additional control circuitry, directly over the top of transistors or RF path can cause improper operation. Care should be taken to locate these components where they will not cause interference.

Ordering Information:

Order Code	Description	DRFT Reference
P200-VHF-H-16-A0	200 VHF Band III TV Linear Pallet Amplifier	4257
PAB200-VHF-H-16-A0	Amplifier in Enclosure	TBD

Options

-A11	SMA Female Connectors In / Out	0201
-A12	Heat Sink Option	0202
-A13	Heat Sink Option with DC Fan, pre wired	0203
-A14	Ruggedized for vibration	0204
-A15	Wire harness, 1' length, 10 wires for pallet amplifier only (NON-FM)	0205
-A16	Wire harness, customer specified length for pallet amplifier only	0206
-T2	Extended Burn In	0271
-T3	Extended Data Collection	0272

Standard Pallet Options:

SMA Female Connectors, Input and Output. Stainless Body, Gold Center pin, 4-hole SMA bolted to pallet amplifier edge through bottom two holes located at amplifiers RF IN and RF OUT locations. All stainless steel hardware.

Enclosure- all aluminum machined enclosure available for most pallet amplifiers. Alodined aluminum, alloy 6061-T6. SMA Female input and output RF connectors. Supply voltage and ground through solder / feedthrough connections. Module must be bolted to appropriate heatsink.

Heat Sink - aluminum extruded heat sink, black anodized. Pallet amplifier or module will be bolted to heatsink. Customer will be required to provide adequate airflow.

Heat sink with fan - aluminum extruded heat sink as above, with included fan bolted to push air through the heat sink. Depending on heat requirements, a second fan may also be provided on the output of the unit.

Ruggedized - all screws have threadlocking compound applied, and all flying components are staked and attached to base. Designed to withstand MIL-STD-810E 514.4 Category 8.

Power Connector - a 10 pin molex connector is used on all standard pallet amplifiers to supply +Vsup and Ground connections, as well as hi-side current shunts for current monitoring. Delta RF offers the mating connector with 1' wires - Red (Vsup), Black (Ground), Yellow (Current monitor). All wires are 18 gauge teflon insulated wires. Customer may optionally specify wire length and wire color.

Testing Options:

Standard - includes power test and brief burn - in under laboratory conditions. Printed test report gives graph of Gain and Input Return Loss at rated P1dB and Voltage Conditions. Report shows pass/fail criteria. All amplifiers include this test.

Extended burn in - 8-hour burn in at P1dB with standard test run at completion. Unit is monitored during test and any discrepancy reported. Standard test data is included.

Extended data collection - Standard data is run and included. Detailed data is taken point by point giving the customer 25 - 70 frequency points, depending on the amplifier model. For each frequency point, data is generated to include gain, input power, input return loss, current, second harmonic, third harmonic, efficiency, audio distortion.

Other tests available - Vibration, Temp cycling, Shock. Please inquire.
